

Web Development Task

To get an understanding of your and back/ front-end development skills we would like you to design and develop a simple product page which allows a user to customise a wedding ring.

We are looking for a very simple HTML, CSS, JS & PHP page/web app which should contain, at minimum, the following elements:

- A product name
- Product price
- A product image
- A mechanism (e.g. button/drop down menu) for changing one or more product options (e.g. the ring size, metal type etc) – this mechanism should be attached to a JavaScript function which accesses a PHP script via an AJAX call. The PHP script should return some JSON which you should then use to update the product price.

You are welcome to include as many elements to the page as you feel are necessary to convey your back/front-end design and development skills.

When complete, please email the files and accompanying assets to christian@weddingrings-direct.com
